Confidential. This report describes security settings for Fabrikam Dental Group; share it only with people who need it.

Summary

We reviewed your Microsoft 365 settings and recommend 11 projects, most urgent first. Each one lists what we found and what the work covers.

1. Admin account hardening

Critical

Admin accounts can change everything in Microsoft 365. Fewer of them, protected by phishing-resistant sign-in, makes a takeover far harder and far less damaging.

WHAT WE FOUND

- 1 admin without MFA, and 1 whose registration isn't known
- 1 admin not covered by MFA
- 1 app with privileged roles
- 2 admins without a phishing-resistant method

WHAT THE PROJECT COVERS

- The right number of Global Administrators, with least-privilege roles for everyone else
- Phishing-resistant sign-in (passkeys or security keys) for every admin
- Cloud-only admin accounts, separate from day-to-day accounts
- A review of apps and guests holding admin roles

Scope: 4 admins

2. Email security

High

Email is how most attacks arrive and how fraud gets paid. Locking down the domain stops others pretending to be the business, and closing forwarding and old protocols stops mail leaking out.

WHAT WE FOUND

- 5 external forwards
- 1 suspicious inbox rule
- 2 domains without DMARC enforcement
- 1 mail domain without DKIM
- 1 domain with SPF problems
- 1 of 1 mail domain doesn't fully enforce MTA-STS
- SMTP AUTH is on for the organisation

WHAT THE PROJECT COVERS

- SPF, DKIM and DMARC set up and enforced for every domain
- Encrypted delivery (MTA-STS and TLS reporting)
- External forwarding and suspicious inbox rules removed and blocked
- SMTP AUTH turned off, mailbox auditing on, shared mailboxes locked

Scope: 58 mailboxes

3. Device management with Intune

High

Company data lives on laptops and phones. Managing them means they're encrypted, kept up to date and can be wiped if lost, and unmanaged devices can be kept away from company data.

WHAT WE FOUND

- 6 of 54 computers not encrypted
- 9 of 55 managed devices not compliant
- 1 of 55 joined computers not in Intune
- 5 devices haven't checked in for 30+ days
- 1 of 57 device records unused for 90+ days

WHAT THE PROJECT COVERS

- Intune enrolment for every company computer (Autopilot for new ones)
- Compliance policies: encryption, updates, antivirus, screen lock
- BitLocker with recovery keys stored in Entra ID
- Clean-up of old devices

Scope: 57 devices

4. Identity and Conditional Access

High

Most break-ins start with a stolen password. Requiring a second factor everywhere, and blocking the old sign-in methods that can't ask for one, stops nearly all of them.

WHAT WE FOUND

- Legacy authentication is allowed
- 27 users without MFA
- Enforced by Require MFA for all users, with 1 exclusion to review
- 4 people can only use a text or call as a second factor

WHAT THE PROJECT COVERS

- Conditional Access policies: MFA for everyone, legacy sign-in blocked, break-glass accounts
- MFA registration drive, moving people off text and call codes to the Authenticator app
- Risky sign-in and risky user handling
- Report-only rollout first, so nobody is locked out

Scope: 54 users

5. App and consent governance

High

Third-party apps can be granted access to mail and files without IT knowing. Reviewing what's there and putting an approval step in place stops data quietly leaving through an app.

WHAT WE FOUND

- 1 app with access to mail, files or the directory
- Users can consent to any app
- 1 app registration with expiring or expired credentials
- Any user can register an app

WHAT THE PROJECT COVERS

- Review of every app with access, removing what isn't needed
- Admin approval workflow for new apps
- Users stopped from registering apps or creating tenants
- Expiring app secrets and certificates renewed

Scope: 2 third-party apps

6. Guest access and external sharing

High

Files shared with anyone who has the link, and guests nobody remembers inviting, are an easy way for data to end up in the wrong hands.

WHAT WE FOUND

- 2 files and folders shared with anyone
- Anyone, including anonymous links
- Anyone, including guests, can invite guests

WHAT THE PROJECT COVERS

- Sharing settings: no anonymous links, sensible defaults
- Existing anyone links reviewed and removed
- Guest invitation rules and a review of current guests
- Old, unaccepted invitations cleared out

7. Windows upgrade and hardware refresh

High

Computers on a Windows version that no longer gets security updates stay open to every flaw found from now on. Upgrading, or replacing machines that can't upgrade, closes that gap.

WHAT WE FOUND

- 7 of 54 Windows computers past end of support

WHAT THE PROJECT COVERS

- Which computers can upgrade in place and which need replacing
- Upgrades scheduled around the working day
- Replacement hardware quoted and set up

Scope: 7 computers

8. Licence and account clean-up

Medium

Licences on accounts nobody uses, and paid licences sitting unassigned, cost money every month and leave old accounts open to misuse.

WHAT WE FOUND

- 7 accounts inactive for 90+ days or never used
- 1 disabled account still licensed
- 2 subscriptions with spare licences

WHAT THE PROJECT COVERS

- Leavers' accounts closed and their licences reclaimed
- Unused paid licences cut at renewal
- Licence assignment errors fixed and renewals checked

Scope: 54 licensed users

9. Security licence upgrade

Medium

The current licences leave out security tools the other projects rely on: Conditional Access, device management or protection from malicious links and attachments. Microsoft 365 Business Premium includes all three; an add-on can cover a single gap.

WHAT WE FOUND

- Links and attachments in email aren't checked when they're opened

WHAT THE PROJECT COVERS

- Licence options and cost comparison (Business Premium or add-ons)
- Switch-over with no interruption to email or files
- Turning on the new protections once they're licensed

Scope: 54 licensed users

10. Teams and groups governance

Medium

Without rules, Teams and groups multiply, lose their owners and keep data nobody is looking after.

WHAT WE FOUND

- 3 teams and groups without an owner

WHAT THE PROJECT COVERS

- Who can create teams and groups
- An owner for every team and group
- Expiry for groups nobody uses

Scope: 10 teams and groups

11. SharePoint storage and archiving

Medium

When SharePoint storage runs out, people can't save files. Clearing old versions and archiving is usually cheaper than buying more space.

WHAT WE FOUND

- 88% of about 1.45 TB used (1 TB + 10 GB × 46 licences)

WHAT THE PROJECT COVERS

- Where the space has gone, site by site
- Version history limits and clean-up
- Archiving, or extra storage where it's needed

Next steps

We'd be glad to talk through any of these and put together a quote.
