Confidential. This report describes security settings for Fabrikam Dental Group; share it only with people who need it.

Summary

We reviewed your Microsoft 365 settings and recommend 6 projects, most urgent first. Each one lists what we found and what the work covers.

1. Email security

High

Email is how most attacks arrive and how fraud gets paid. Locking down the domain stops others pretending to be the business, and closing forwarding and old protocols stops mail leaking out.

WHAT WE FOUND

- 5 external forwards
  Goal: No mail is forwarded outside the organisation
- 1 suspicious inbox rule
  Goal: No inbox rules hide mail
- 1 mail flow rule sends mail outside the organisation
  Goal: No mail flow rule sends mail outside the organisation
- 2 sender domains skip the spam filter
  Goal: No sender domains are allowed past the spam filter
- 2 domains without DMARC enforcement
  Goal: Every domain enforces DMARC
- 1 mail domain without DKIM
  Goal: DKIM signing is on for every mail domain
- 1 anti-phishing policy weakens spoof protection
  Goal: Spoof protection is on
- 1 anti-malware policy lets risky attachment types through
  Goal: Risky attachment types are blocked
- 1 domain with SPF problems
  Goal: Every domain has a working SPF record
- 1 of 1 mail domain doesn't fully enforce MTA-STS
  Goal: Mail domains require encrypted delivery (MTA-STS)
- SMTP AUTH is on for the organisation
  Goal: SMTP AUTH is turned off

WHAT THE PROJECT COVERS

- SPF, DKIM and DMARC set up and enforced for every domain
- Encrypted delivery (MTA-STS and TLS reporting)
- External forwarding and suspicious inbox rules removed and blocked
- SMTP AUTH turned off, once scanners and apps send mail another way
- Mail flow rules that let spam in or send copies out fixed
- Spam, phishing and malware policies tightened: allowed senders, spoof protection, attachment filter

Scope: 58 mailboxes

2. Identity and Conditional Access

High

Most break-ins start with a stolen password, and admin accounts are the biggest prize. Requiring a second factor everywhere, blocking the old sign-in methods that can't ask for one and locking down admin accounts stops nearly all of them.

WHAT WE FOUND

- Legacy authentication is allowed
  Goal: Legacy authentication is blocked
- 27 users without MFA
  Goal: Every active user has MFA registered
- 1 guest with admin roles
  Goal: No guests hold admin roles
- 1 admin not covered by MFA
  Goal: Every admin is covered by an MFA policy
- Enforced by CA002 — All users: Require MFA, with 1 exclusion to review
  Goal: MFA is enforced for all users
- 1 app with privileged roles
  Goal: Apps with admin roles are reviewed
- 2 admins without a phishing-resistant method
  Goal: Admins use phishing-resistant sign-in methods
- 4 people can only use a text or call as a second factor
  Goal: Nobody relies on a text or call as their only second factor

WHAT THE PROJECT COVERS

- Conditional Access policies: MFA for everyone, legacy sign-in blocked, break-glass accounts
- MFA registration drive, moving people off text and call codes to the Authenticator app
- Admin accounts: separate, cloud-only and signing in with a passkey or security key
- Admin roles: the right number of Global Administrators, none held by guests, apps reviewed
- Report-only rollout first, so nobody is locked out

Scope: 55 users

3. Device management with Intune

High

Company data lives on laptops and phones. Managing them means they're encrypted, kept up to date and can be wiped if lost, and unmanaged devices can be kept away from company data.

WHAT WE FOUND

- 6 of 54 computers not encrypted
  Goal: Company computers are encrypted
- 9 of 55 managed devices not compliant
  Goal: Managed devices meet compliance policies
- 8 of 55 joined Windows computers without a saved recovery key
  Goal: Windows computers have their BitLocker recovery key saved
- No compliance policy for iOS/iPadOS
  Goal: Every platform in use has a compliance policy
- 1 of 55 joined computers not in Intune
  Goal: Joined computers are managed by Intune
- 5 devices haven't checked in for 30+ days
  Goal: Managed devices check in with Intune
- 1 of 57 device records unused for 90+ days
  Goal: No old devices left in Entra ID

WHAT THE PROJECT COVERS

- Intune enrolment for every company computer (Autopilot for new ones)
- Compliance policies: encryption, updates, antivirus, screen lock
- BitLocker with recovery keys stored in Entra ID
- Clean-up of old devices and ones that stopped checking in

Scope: 57 devices

4. File sharing and guest access

High

Files shared with anyone who has the link, guests nobody remembers inviting and sites and teams nobody owns are an easy way for data to end up in the wrong hands.

WHAT WE FOUND

- 2 sites with no owner, 2 sites with one owner
  Goal: Every site has at least two owners
- 1 guest with full control of 1 site
  Goal: Guests don't have full control of sites
- Anyone, including anonymous links
  Goal: Files can't be shared with anonymous links
- 2 files and folders shared with anyone
  Goal: No files are shared with anyone links
- 2 files and folders outside people can edit
  Goal: People outside can only view shared files
- 4 teams and groups without an owner
  Goal: Every team and Microsoft 365 group has an owner
- Anyone, including guests, can invite guests
  Goal: Only admins and members can invite guests

WHAT THE PROJECT COVERS

- Sharing settings: no anonymous links, sensible defaults
- Existing sharing reviewed: anyone links removed, outside editors cut to view-only
- Guest invitation rules and a review of current guests
- An owner from the business for every site, team and group

Scope: 7 sites

5. Windows upgrade and hardware refresh

High

Computers on a Windows version that no longer gets security updates stay open to every flaw found from now on. Upgrading, or replacing machines that can't upgrade, closes that gap.

WHAT WE FOUND

- 7 of 54 Windows computers past end of support
  Goal: Windows computers still get security updates

WHAT THE PROJECT COVERS

- Which computers can upgrade in place and which need replacing
- Upgrades scheduled around the working day
- Replacement hardware quoted and set up

Scope: 7 computers

6. Storage and archiving

Medium

When storage runs out, people can't save files or receive email. Clearing old versions and archiving is usually cheaper than buying more space.

WHAT WE FOUND

- 88% of about 1.45 TB used (1 TB + 10 GB × 46 licences)
  Goal: SharePoint storage isn't nearly full
- 3 mailboxes at or over 90% of quota
  Goal: No mailbox is nearly full

WHAT THE PROJECT COVERS

- Where the SharePoint space has gone, site by site
- Version history limits and clean-up
- Online archive and retention for mailboxes that are nearly full
- Extra storage only where it's still needed

Next steps

We'd be glad to talk through any of these and put together a quote.
